

Embrace flexible remote access that's fully data-security compliant

Keep clients' private data safe while expanding access for global and remote employees

HP Anyware provides secured remote access to powerful workstations, so financial traders and the third-party resource providers who support them can increase reactivity, continuity, efficiency, and productivity while safeguarding private data and intellectual property.

When even microseconds can mean a difference of millions, traders are looking for every advantage and must be extremely protective of their information. The ability to log in to a virtual workstation from anywhere on any authorized device effectively maximizes responsiveness and data security, which provides a significant advantage in a highly competitive industry.

Centralized computing accessed by remote endpoints co-locates data and apps in close proximity to storage, which reduces latency for greater workstation responsiveness. It also effectively reduces the costs associated with trading-floor installations, moves, adds, and changes (iMACs) and increases IT responsiveness to minimize catastrophic downtime.

Accessing remote workstations with zero-client or thin-client devices gives users the same responsive experience they would have on a high-performance local desktop, but without the risk of intellectual property or private client data being intercepted or leaked. It's a hands-on experience that, from a security perspective, is completely hands off.

Finding the right digital workspace solution for trading-floor applications

Protecting private financial data and intellectual property in a remote trading-floor environment requires ultra-secure file and application access with real-time responsiveness that mimics the experience of working in person on a local workstation.

When evaluating digital workspace solutions, you should look for one that is inherently secure and seamlessly recreates the workstation experience. It should provide uninterrupted business continuity, full application capabilities, smooth image display across multiple high-resolution monitors, and lossless reproduction of text—regardless of location or network conditions.

The PCoIP (PC-over-IP) remote display protocol transfers only fully encrypted pixels. Sensitive information never leaves the data center, so no one can tamper with data or infiltrate systems by compromising remote endpoint devices.

Only HP Anyware can deliver highly responsive remote access to an array of data analytics and 2D and 3D data visualization applications that traders rely on for a competitive advantage. It lets you quickly provision specific virtual desktops to the differing needs of specific users.

HP Anyware is also a perfect dynamic remote access solution for third-party vendors who develop data analytics software, manage business operations, and deliver the financial reporting services that trading firms need.

Redbrick Associates

Back-office services for the finance industry

Problem

Struggling to keep every client's financial data segregated and secure with local data storage, Redbrick's IT teams were overburdened and lacked a business continuity plan that could hold up under disaster and emergency conditions.

Solution

PCoIP remote display protocol powering Amazon WorkSpaces

PCoIP Zero Clients

Result

Leveraging PCoIP technology, client data never leaves Amazon's secured data centers, and every client has its own separate virtual desktop provisioned for each Redbrick employee who works on that client. Employees can log in and out of virtual desktops dedicated to each customer throughout the day, even when working remotely. IT is also simplified by eliminating VPN needs and on-site service calls.

Work more securely everywhere with the power of HP Anyware

Here are a few of the benefits HP Anyware can bring to traders and the third-party solution providers that support them

MORE RESPONSIVE ACCESS TO DRIVE BETTER DECISION-MAKING

HP Anyware provides ultra-secure, latency-free remote access to the data, applications, and storage that traders need, maximizing the effectiveness of their transactions. PCoIP® remote display technology dynamically adapts to LAN or WAN network conditions in real time. It accelerates the performance of software and applications, so portfolio managers and floor traders can react and transact with optimal speed.

HACKERS DON'T STAND A CHANCE AGAINST THE POWER OF THE PIXEL

Because HP Anyware transmits only encrypted pixels, no data ever leaves your data center or secured public cloud data store. Users can directly access, analyze, and manipulate intellectual property without actually touching it, which helps keep private client data, proprietary algorithms, and intellectual property secure. It also minimizes the vulnerability of endpoints to attack.

QuantumRoot

Automated hedge-fund-trading software development company

Problem

QuantumRoot struggled to meet stringent security requirements for protecting data and intellectual property (IP) while also delivering a flexible, hybrid work experience for an international team of developers. Its employees needed to access two dedicated workstations—one for coding and testing and another for continuous integration.

Solution

HP Anyware leveraging the PCoIP® remote display protocol

Site-to-site VPN data center networking

Result

Now the company has greater flexibility to hire developers anywhere in the world, giving them their choice of Windows or Linux development environment with workstations colocated in secured data centers in the US and Europe. Coding and testing tools are more responsive, especially over low-bandwidth connections. Information never leaves the data center and is further protected by centrally managed configurations that allow copy and paste into resources on the network—but not off it.

SIMPLY PUT, IT SIMPLIFIES I.T. MANAGEMENT

It's easy to deploy HP Anyware on virtually any combination of infrastructure, host environments, endpoint devices, and operating systems. A single management interface called Anyware Manager, lets you automatically provision remote desktops, manage access and optimize performance at the user level, and enable secure PCoIP connections on any approved device. PCoIP solutions also reduce time spent on infrastructure management and minimize a trader's system downtime.

BOTTOM-LINE PROTECTION FROM THE TOP DOWN

Virtualizing workstations decreases the cost and complexity of your entire IT system. Replacing traditional workstations that employ localized software and storage with low-cost PCoIP zero clients radically reduces desktop IT support needs. Zero clients also draw less power and produce less heat than traditional endpoints, dropping trading-floor cooling costs by as much as half in some deployments. HP Anyware also lets you power resources up and down as needed, so you'll never pay for connections that aren't in use—further controlling operational costs.

EMBRACE THE CLOUD ON YOUR TERMS

The multi-cloud flexibility of HP Anyware supports any mix of on-premises, private, or public cloud environments; Windows, Linux, or macOS virtual workstations; with or without GPUs. This enables cost-effective hybrid deployments that bridge on-premises and public cloud workstations.

About our technology

HP Anyware leverages PCoIP® remote display technology to deliver a high-definition and highly responsive computing experience through the most challenging network conditions.

PCoIP technology was invented in 2004, and although it has been imitated, PCoIP technology continues to reach new heights.

PCoIP® encodes, compresses, encrypts, and transports image pixels from a central server or workstation.

It then decrypts and decompresses the image for users to interact with on any endpoint.

No business information ever leaves your secured cloud, data center, or workstation.

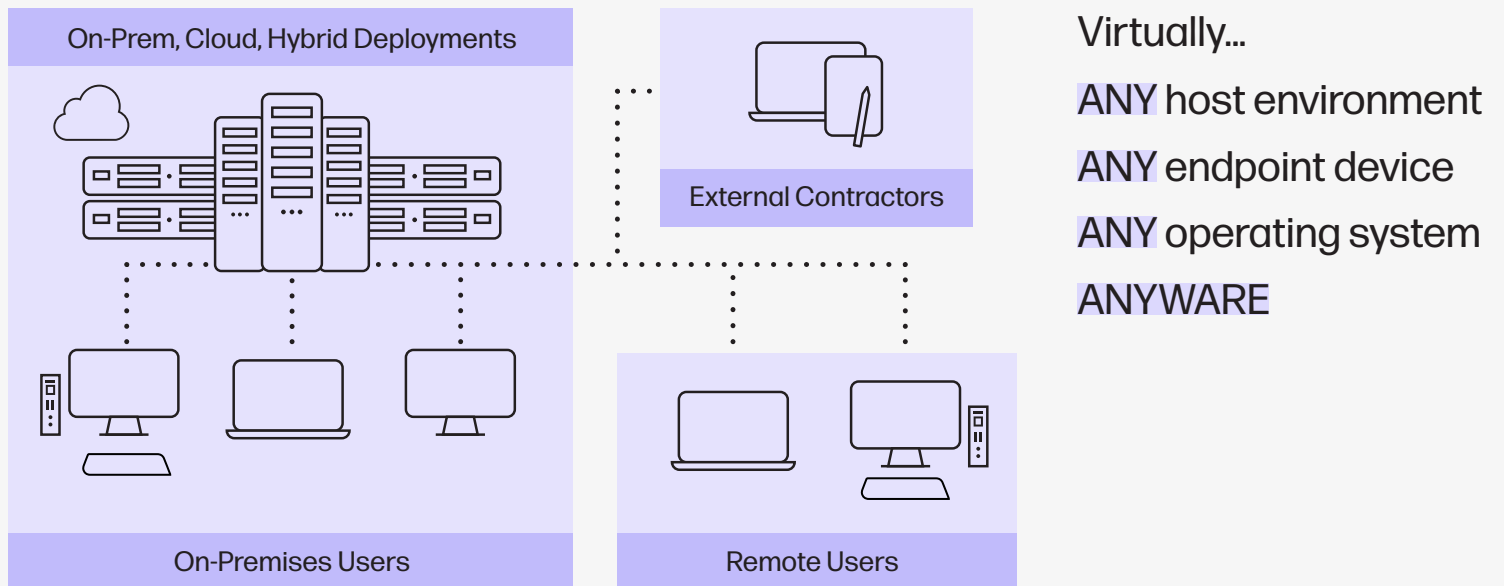

How PCoIP remote display technology works

Not every remote display technology can be the boss

If you've ever accessed a digital workspace, you've likely encountered a PCoIP protocol. The PCoIP protocol was originally developed by Teradici—now part of HP—so HP Anyware users get the benefit of licensing the software directly from the people who created it and are best equipped to support it. Built on the same technology that won both Teradici and HP an Engineering Emmy® in 2020, HP Anyware creates a color-accurate experience, multi-monitor support, and dynamic network adaption that sets it apart from its competitors.

The PCoIP® protocol transfers only display information in the form of pixels, so no data or information ever leaves your cloud, data center, or workstation. Because enterprise data and software are secured inside central systems, no one can tamper with your client's data or compromise your remote endpoint devices.

PCoIP advanced display compression allows users to remotely access on-premises workstations or virtual machine instances in local data centers or public clouds from a range of devices. While other technologies burden network and system resources, PCoIP® remote display technology offers a working experience that's nearly indistinguishable from sitting at a local workstation, whether you're 10 or 1,000 miles away.

LEARN MORE AT [HP.COM/ANYWARE](https://hp.com/anyware)

HP Anyware requires network access. HP Anyware supports Windows®, Linux®, and MacOS® host environments and Windows, Linux, MacOS, iOS®, Android®, and Chrome OS® end-user devices. For more on the system requirements for installing HP Anyware, refer to the Admin Guides at: <https://docs.teradici.com/find/product/cloud-access-software>
